

ABSTRACT

Methods of treatment in humans of inoperable tumors are disclosed. In particular, the disclosed method is useful for treatment of brains tumors, for example, glioblastomas, tumors of the otorhinolaryngologic sphere, rectal tumors, osseous, hepatic or brain metastasis and non-malignant cystic tumors such as craniopharyngiomas. In the method of treatment, biodegradable microspheres which release an anticancer agent are administered by stereotactic injection directly into the tumor, into the peritumoral area or at the same time into the tumor and the peritumoral area.
